ABSTRACT: SOLAR-ERA.NET is a network that brings together more than 20 RTD and innovation programmes in the field of solar electricity technologies in the European Research Area. The network of national and regional funding organisations has been established in order to increase transnational cooperation between RTD and innovation programmes and to contribute to achieving the objectives of the Strategic Energy Technology Plan (SET-Plan) through dedicated transnational activities (especially transnational calls). Through the support of the funding organisations, some 100 MEUR have been mobilised for transnational RTD and innovation projects through six joint calls carried out. In this contribution, results are presented for the transnational SOLAR-ERA.NET calls.

Keywords: R&D and Demonstration Programmes, Photovoltaic, Funding and Incentives, Strategy

1 INTRODUCTION AND CONTEXT

SOLAR-ERA.NET is a European network of national and regional funding organisations and RTD and innovation programmes in the field of solar electricity generation, i.e. photovoltaics (PV) and solar thermal electricity (STE) / concentrating solar power (CSP). SOLAR-ERA.NET contributing to reaching the objectives of the European Strategic Energy Technology Plan (SET-Plan), by carrying out the coordination and support actions between national and regional research and innovation programmes.

The SET-Plan aims to increase, coordinate and focus EU support on key low-carbon energy technologies in order to achieve Europe’s 2020 and 2030 energy and climate objectives in the future.

2 NETWORK AND MISSION

2.1 Network

SOLAR-ERA.NET involves more than 20 national and regional RTD and innovation programmes dealing with PV and CSP. This high level of involvement of most relevant stakeholders provides excellent outreach and allows for a solid coordination needed for an efficient and coherent approach in the highly diverse RTD landscape.

The network has been composed of some 20 organisations being programme owners and managers. Most countries and regions belonging to the SOLAR-ERA.NET consortium also participate in most calls.
2.2 Missions and goals

SOLAR-ERA.NET has two fundamental missions. As a network supported by the EC within the ERA-NET (2012-2016) respectively ERA-NET Cofund (since 2016) scheme, the mission is to improve the coordination and cooperation between national and regional programmes. In the context of the Strategic Energy Technology Plan, the mission of the network is to implement central parts of the SET plan on a transnational level and thus contribute to achieving the goals defined in the SET plan.

The more specific and essential goals and activities of SOLAR-ERA.NET are i) to launch joint calls for RTD proposals by national and regional RTD and innovation programmes and ii) to define and support the best joint activities, strategic information exchange and use of implementation tools.

By identifying and choosing priority topics based on the Implementation Plans for PV respectively CSP for transnational calls, the SOLAR-ERA.NET network selects and funds industrially relevant transnational RTD and innovation projects in the field of solar electricity technologies.

In quantitative, financial terms, SOLAR-ERA.NET shall result in a total funding volume by the participating national and regional programmes of 10 to 15 MEUR per call for innovative projects.

3 ACTIVITIES, FACTS AND FIGURES

3.1 Set up of transnational calls

SOLAR-ERA.NET started in November 2012. Six joint calls have been launched so far, with the participation of up to 17 countries / regions covering PV and CSP topics.

Call topics in photovoltaics (PV) and concentrating solar power (CSP) are commonly defined by the SOLAR-ERA.NET consortium and adopted by the participating programmes and countries according to their national / regional priorities. The current topics can be found in Figure 2.

![Figure 2: Topics defined for the 7th SOLAR-ERA.NET joint call](image-url)
3.2 Participation in transnational calls

The six joint calls found good interest in the solar power industry sector and research community. 283 preproposals were submitted with a total budget of some 360 MEUR (of which 250 MEUR funding requested) involving 1,263 partners (multiple counting – some partners have been involved in several preproposals).

About half of the preproposals were selected for the second stage of the call procedure, resulting in 144 full proposals.

80 transnational projects were funded (of which 20 are selected for funding in the most recent call). The total public funding committed amounts to approx. 68 MEUR for a total project volume of around 100 MEUR. 408 partners are involved in these transnational projects funded (multiple counting). A slight majority of the organisations involved belong to the categories of small and medium sized enterprises and large enterprises.

Among the 80 projects (to be) funded, 45 projects involve partners from Germany and 37 projects have partners from Spain. Figure 3 shows the number of projects by country / region as well as by call. The funding share per country / region is displayed in Figure 4.

4 RESULTS AND OUTLOOK

4.1 Selected results

On the level of research, development and innovation, SOLAR-ERA.NET is – through its six joint calls launched so far – supporting 80 transnational PV and CSP projects and mobilising some 100 million euros and involving some 400 organisations from the scientific community and the industry sector. By the time of writing this paper, 22 transnational PV projects have been finalised and can be summarised as follows:

- HESiTSC: exploited the innovative direct III-V/Si heterojunction concept for improving the efficiency and paving the way for an aggressive cost reduction of c-Si based tandem solar cells (SiTSC) at industrial scale.
- Monoscribe: integrated the selective laser ablation processes and printing processes allowing for producing roll-to-roll CIGS PV modules with varying voltages, sizes and shapes.
- CNT-PV: developed press-transferred, semitransparent, extremely flexible single-wall carbon nanotube films (CNT) functioning as a hybrid hole-transporting and collecting layer in the perovskite solar cell and avoiding expensive hole-transporting materials and silver or gold contacts.
- InnoModu: demonstrated that it is possible to build PV modules with reduced silver content and without using lead.
- NovaZOlar: eliminated Cd-containing buffer layer in CIGS solar cells and achieved a record efficiency of 21.0%.
- NOVACOST: developed eco-friendly metallic salt-based inks suitable for CZTS deposition and building devices with an efficiency of 6.6%, paving the way to 10% efficiencies.
- LIMES: worked on the glass composition and adding optically active components which absorb harmful UV light (at least 4% less) and simultaneously convert those UV photons into visible light (related efficiency
The optimisation of the glass composition allowed for thinner glass and improvements of the crack resp. chemical resistance by a factor of 3 respectively 4.

- **PV me:** integrated organic PV modules into steel resp. glass based façades, developed a hard coat that can be roll-to-roll coated on top barrier foils and realised a micro-inverter specifically suitable for organic PV modules. The project ended with one of the largest organic-based BIPV façade installation in Benelux.

- **BLACK:** demonstrated that high quality black silicon surface is applicable in industrial-scale solar cell processes, namely in passivated and emitter rear cells (PERC). Additionally, the nanostructured surfaces eliminated the light-induced power conversion degradation.

- **AER II:** developed, industrialised and brought to market the aesthetic energy roof (AER) concept. A project realised with this concept won the prize “Most beautiful solar project of the Netherlands”.

- **PV4FACADES:** developed low-cost, high-efficiency c-Si back contact cell technologies (metal wrap through and interdigitated back contact) with improved aesthetics and higher energy yield for industrial take-up.

- **InGrid:** developed a new module technology for high efficiency rear contact and bifacial solar cells by interconnecting cells with conductive tracks embedded in the encapsulation material, replacing the ribbon typically used.

- **PV2GRID:** designed a grid side converter improving performance ensuring the proper grid integration of PV systems under any grid conditions.

- **INTESEM:** implemented a virtual power plant (VPP) to optimise intermittent generation and storage assets and to facilitate efficient distribution of energy. The simulations showed a 10-20% better revenue on the day-ahead market compared to a normal PV site.

- **ACCESS-CIGS:** explored atmospheric cost competitive elemental Sulpho-Selenisation for CIGS in order to reduce the CIGSsSe processing cost and improve the conversion efficiency.

- **U-light:** developed new light weight, high efficiency and long life-time modules by using thin, strong, low-cost glass and mineral or organic compositions like glass-fibre reinforced plastic.

- **HighCast:** focused on research and development of advanced casting and wafering techniques for producing silicon wafers suitable for higher efficiency solar cells, using alternative casting techniques comprising “High Performance Multicrystalline Silicon” (HPmcsi) and “Mono-Casting”.

- **APPI:** developed high-efficiency Passivated Emitter and Rear Cell (PERC) solar cells manufactured by using low-cost atmospheric pressure processing, namely advanced texturing, high-efficiency emitter and atmospheric pressure passivation.

- **FunGlass:** developed chemically functionalised surfaces for glass enabling optimised (anti-reflective, light trapping and light diffusion) glass properties without deposition of additional coatings.

- **SPRINTCELL:** proposed an innovative thin-film photovoltaic fabrication route offering lower manufacturing costs, using earth abundant photovoltaic materials, namely Cu2ZnSnS4, in terms of natural reserve and annual ore production, and selecting technologies for large-scale commercial powder synthesis, advanced powder milling, novel solar ink formulation and solution-based non-vacuum film processing.

- **HVolt-PV:** designed and developed High Voltage IBC Photovoltaic i-Cells and Modules by integrating several smaller cells onto a single silicon wafer and eliminating line losses, achieving efficiency of above 20%.

- **PROOF:** worked on an industrialised concept for BIPV/BAPV roofs visualising several added values and minimising additional costs.

The remaining PV and CSP projects funded within the first four SOLAR-ERA.NET joint calls are:

- **SNOOPI:** Smart Network Control with Coordinated PV Infeed

- **THESEUS:** Tandem High Efficiency Solar Cells Utilizing III-V Semiconductors on Silicon

- **EDITOR:** Evaluation of the Dispatchability of a Parabolic Trough Collector System with Concrete Storage

- **SITEF:** Silicone Fluid Test Facility

- **SolFieOpt:** Optimal Heliostat Fields for Solar Tower Power Plants

- **BIPVpod:** Building Integrated Photovoltaics Panels on Demand

- **DINAMIC:** Dilute Nitride Based Concentrator Multi-junction Solar Cells, with Efficiencies over 47%

- **ALCHEMI:** A Low Cost, High Efficiency, Opto-electronic HCPV Module for 1000 Sun Operation

- **IPERMON:** Innovative Performance Monitoring System for Improved Reliability and Optimized Levelized Cost of Electricity

- **Bifalo:** Bifacial PV Modules for Lowest Levelized Cost of Energy

- **HESTPV:** High-Efficiency and Stable Tin-Based Perovskite Solar Cells

- **HIPPO:** High-Efficiency Poly-Si Passivated Contact Solar Cells and Modules

- **INFORPV:** Innovative Forecasting PV Energy Yield Solution for Sustainable Large Scale Deployment

- **Liquid Si 2.0:** Liquid Phase Deposition of Functional Silicon Layers for Cost-Effective High Efficiency Solar Cells

- **FrontCIGS:** Re-Designing Front Window in Flexible CIGS Modules for Cost-Effective Moisture Protection

- **SIMON:** Silicone Fluid Maintenance and Operation

- **DURACIS:** Advanced Global Encapsulation Solutions for Long Term Stability in Industrial Flexible Cu(In,Ga)Se2 Photovoltaic Technology

- **Refined PV:** Reduction of Losses by Ultra Fine Metallization and Interconnection of Photovoltaic Solar Cells

- **ENHANCE:** Enhanced Rooftop PV Integration through Kinetic Storage and Wide Area Monitoring

- **HIPER:** High-Efficiency Si Perovskite Tandem Solar Cells

- **PEARL TF-PV:** Performance and Electro luminescence Analysis on Reliability and Lifetime of Thin-Film Photovoltaics
Throughout the Information Exchange and Matchmaking Event held at the premises of Intersolar in May 2019, the following success factors were identified for potential applicants:

- Start with a good idea and have a vision how to realize it
- Build strong, complementary and trustful partnerships
- Communicate with partners and funding agencies
- Respect formal requirements / conditions
- Avoid redundancies with existing projects / proposals
- Identify innovation – excellence
- Head for industrial orientation – impact
- Provide convincing project plan – implementation
- Secure a high transnational value
- SMART Goals (Specific, Measurable, Ambitious, Realistic, Time Bound) / Key Performance Indicators

SOLAR-ERA.NET not only allows for supporting innovative research projects on a transnational level but also provides added value in terms of networking and programming, namely:

- New industry-led innovation projects and partnerships in a strongly competitive environment
- More transnational cooperation bottom-up and “cut to measure”
- Larger and more diverse portfolio
- Common initiatives and implementation activities
- Networking and collaboration between countries across Europe
- Overview on European research and insight into trends
- Best practice for supporting projects on the transnational level

Yet, there is a number of challenges respectively opportunities for further improvements related to the ERA-NET Cofund instrument used in Horizon2020:

- Adequacy and adaptability of European, national and regional funding budgets (Funding needs identified in the SET-Plan are considerably higher than funding budgets actually made available.)
- Flexibility to overcome the “funding gap” by following the ranking list with individual funding budgets running out already further up in the ranking list
- Consideration and inclusion of less strong ERA countries
- Visibility of impact through transnational projects and related projects
- Targeted and fair redistribution / use of Top-Up (Ideally, all funding agencies and transnational projects get the same share of the Top-Up.)
- Minimum extra administrative workload for agencies and project partners on transnational level
- Synchronisation of the timeline with all funding agencies (especially in the negotiation and contractual phase)
- Pragmatic handling (e.g. making reserve list possible)

Summing up, SOLAR-ERA.NET and SOLAR-ERA.NET Cofund have become a key instrument for cooperation among research and innovation agencies in Europe.
The 7th SOLAR-ERA.NET call (additional joint call within SOLAR-ERA.NET Cofund 2) comes along with a total funding budget of up to some 10 MEUR. It shall be launched on 7th of October 2019 and the first stage ends on 29th of January 2020 with the deadline for submission of preproposals.

The coordinator of a finalised transnational projects summarised the role of SOLAR-ERA.NET as follows: “SOLAR-ERA.NET allows for real added value, namely transnational cooperation with complementary skills, equipment and facilities, along the value chain from research to industry and better reaching out to the different markets in Europe and beyond.”

REFERENCES
